

Kryso Resources plc

Initial Hukas Assay Results

Kryso Resources plc (the Company) (KYS.L), the Tajikistan-based minerals group, is pleased to announce initial trench assay results from its 100% owned Hukas Nickel-Copper Project located in Central Tajikistan, the licence for which was awarded to the Company in July 2006.

The channel samples were collected from three manually excavated trenches across a 20 metre-long exposure of a lens-like, gossaniferous body that crops out on surface in the Licence Area. After being transported to the Company's laboratory in the capital city Dushanbe, which is accredited by the State Standards Committee of Tajikistan, they were prepared and analysed for copper and nickel. The highlights of the assays were:

Trench 1 (East): 1.17% Ni and 1.09% Cu over 6.2m (approximately true width)
Trench 2 (Central): 1.57% Ni and 1.21% Cu over 6.75m (approximately true width)
Trench 3 (West): 1.03% Ni and 0.62% Cu over 2m (approximately true width)

These results confirm the Soviet findings of the presence of potentially economic nickel and copper mineralization at Hukas. Next year a more detailed exploration programme will be carried out, which will include diamond core drilling and a ground-based geophysical survey.

The Company is still on track to produce an initial JORC compliant resource statement for its 100% owned Pakrut Gold Deposit during the first quarter of 2007 using information obtained from its current exploration drilling and sampling programme. Following this initial resource statement a full feasibility study will commence.

This information has been approved for release by Dr Trevor Davenport, B.Sc, M.Sc, Ph.D, MIMM, C.Eng, and Chairman of Kryso. Dr Davenport has more than 30 years experience in the exploration and mining industry and has consented to the inclusion of the material and context in which it appears.
